Project Name: Farmer Crop Insurance Claim Tracking System – Bihar

Introduction

Bihar's farmers fight two battles every year — one against nature, and another against paperwork.
Floods wash away crops overnight. Droughts destroy months of hard work silently. When farmers turn to crop insurance for support, they enter a claim process that is slow, confusing, and heavily dependent on manual verification.

Today, crop insurance claims are handled through multiple forms, physical document submissions, and repeated office visits. Farmers often travel long distances just to ask one question:

"Has my claim been approved?"

Unfortunately, most of them receive no clear answer. Claims get stuck due to missing documents, delays in verification, and lack of communication between departments. Officers handle hundreds of files manually, and tracking progress becomes nearly impossible. There is no centralized system to monitor where a claim is blocked, who is responsible, or how long it has been pending.

Problems Identified

The major problems identified in the existing crop insurance claim process are:

1. Manual Paperwork and Slow Processing

Claims are still processed through physical files and manual verification, which increases time and workload.

2. No Proper Claim Tracking System

Farmers do not have any online platform to check whether their claim is submitted, verified, approved, or rejected.

3. Repeated Office Visits

Farmers must travel to offices multiple times just to ask about claim updates, which wastes time and money.

4. Missing Document Delays

Many claims get delayed because farmers unknowingly miss submitting required documents. Officers also face difficulty in informing farmers.

5. Lack of Communication and Notifications

There is no automated system to notify farmers about claim updates, missing documents, or approval status.

6. Poor Transparency in Verification Process

Farmers cannot know who is handling their claim, what stage it is in, and why it is delayed.

7. No Approval History or Logs

The system does not maintain a proper record of actions performed on a claim (verification date, officer remarks, approval steps).

8. Difficulty for Officers to Manage Large Claims

Officers struggle to manage and monitor thousands of claims manually, leading to backlog and inefficiency.

9. Limited Reporting and Analytics

Government departments cannot quickly generate reports such as district-wise pending claims, disaster-wise claims, or rejection reasons.

10. Increased Financial Stress for Farmers

Because of delayed claims, farmers struggle to arrange money for next crop cultivation, loans, and daily needs.
